1. Run interactive job:
longer:
[athena][plguser@login01 ppss_2026]$ srun -p plgrid-gpu-a100 -N 1 --ntasks-per-node=1 -n 1 -A plgbelle2ml26-gpu-a100 -t 3:00:00 --pty /bin/bash -l
or short one:
[athena][plguser@login01 ppss_2026]$ srun -p plgrid-now -N 1 --ntasks-per-node=1 -n 1 -A plgbelle2ml26-gpu-a100 -t 1:00:00 --pty /bin/bash -l

2. Load modules:
[athena][plguser@t0024 ppss2026vens]$ module load GCCcore/14.3.0 Python/3.13.5
GCCcore/14.3.0 loaded.
zlib/1.3.1 loaded.
binutils/2.44 loaded.
bzip2/1.0.8 loaded.
ncurses/6.5 loaded.
libreadline/8.2 loaded.
libtommath/1.3.0 loaded.
Tcl/9.0.1 loaded.
SQLite/3.50.1 loaded.
XZ/5.8.1 loaded.
libffi/3.5.1 loaded.
OpenSSL/3 loaded.
Python/3.13.5 loaded.

3. Install virtual env with python modules **at project space:**

[athena][plguser@t0024 plguser]$ cd **$PLG_GROUPS_STORAGE**/plggbelle2ml
[athena][plguser@t0024 plguser]$ mkdir -p ppss2026vens; cd ppss2026vens;

[athena][plguser@t0024 ppss2026vens]$ python3 -m venv jupyter-ppss26
[athena][plguser@t0024 ppss2026vens]$ source jupyter-ppss26/bin/activate
(jupyter-ppss26) [athena][plguser@t0024 ppss2026vens]$ python3 -m pip --no-cache-dir --require-virtualenv install ipykernel uproot numpy matplotlib pandas awkward-pandas scikit-learn xgboost vector

4. Save installed modules with versions:
(jupyter-ppss26) [athena][plguser@t0024 ppss2026vens]$ python3 -m pip --require-virtualenv freeze > requirements_jupyter-ppss26.txt

5. Install jupyter kernel.
(jupyter-ppss26) [athena][plguser@t0024 ppss2026vens]$ python3 -m ipykernel install --user --name "ppss2026" --display-name "3.13.5-ppss2026" --env PYTHONPATH ""
Installed kernelspec ppss2026 in
/net/people/plgrid/plguser/.local/share/jupyter/kernels/ppss2026
